

# Welcome to CHE 384T: Computational Methods in Materials Science

## Random Walk Diffusion

LeSar Ch. 2, App. B7, C5, I2-I3

The University of Texas at Austin  
McKetta Department  
of Chemical Engineering  
Cockrell School of Engineering

# Announcements

Python Pre-test  
Due 08/30 11:59pm

Bring a computer to Friday Lecture

Programming Days (approximately every other Friday):

L3	F Aug 30	Installation/set up; Jupyter, Modules and packages, environments What is object oriented programming? Why Python? global v local variables, manipulating lists and arrays, operators, (formatting strings), sets, tuples, lists, dictionaries, dataframes conditions, loops, functions, classes and objects
L5	F Sep 6	
L12	F Sep 20	opening a github account, testbeds, measuring speed and optimizing code, C libraries, documentation/sphinx, PEP8
L18	F Oct 4	ASE calculators
L24	F Oct 18	Python extras: list comprehension, exception handling decorators, lambda functions, regular expressions Peer sharing of Python tricks
6	F Nov 1	DFT tutorial: convergence, scf, relaxation, band structure advanced: phonon calculation, magnetic materials, surface properties

## Approximate Schedule and Reading list for CHE384T

L1	Intro to the Course	Ch. 1, Appendix A
L2, L5	Random Walk Diffusion	Ch. 2, Appendix B7, C5, I2-I3
L7, L8	Intro to crystal structure, defect in materials	Appendix B1-B5
L10	Simulating finite systems	Ch. 3
L11, L13 L14	Interatomic potentials	Ch. 5
L16-L22	Molecular dynamics	Ch. 6, Appendix I4 Appendix G
L23, L25	Monte Carlo	Ch. 7, Appendix C4, D1-D4
L25-L32	Electronic structure and DFT	Ch. 4, Appendix F, Supplemental reading
L34	Materials informatics	
L35	Kinetic Monte Carlo	Ch. 9
L37	Monte Carlo as mesoscale Cellular automata	Ch. 11
L38	Quantum computing	

# Lecture Outline

What is diffusion

Examples of diffusion in materials science

Connection with continuum description

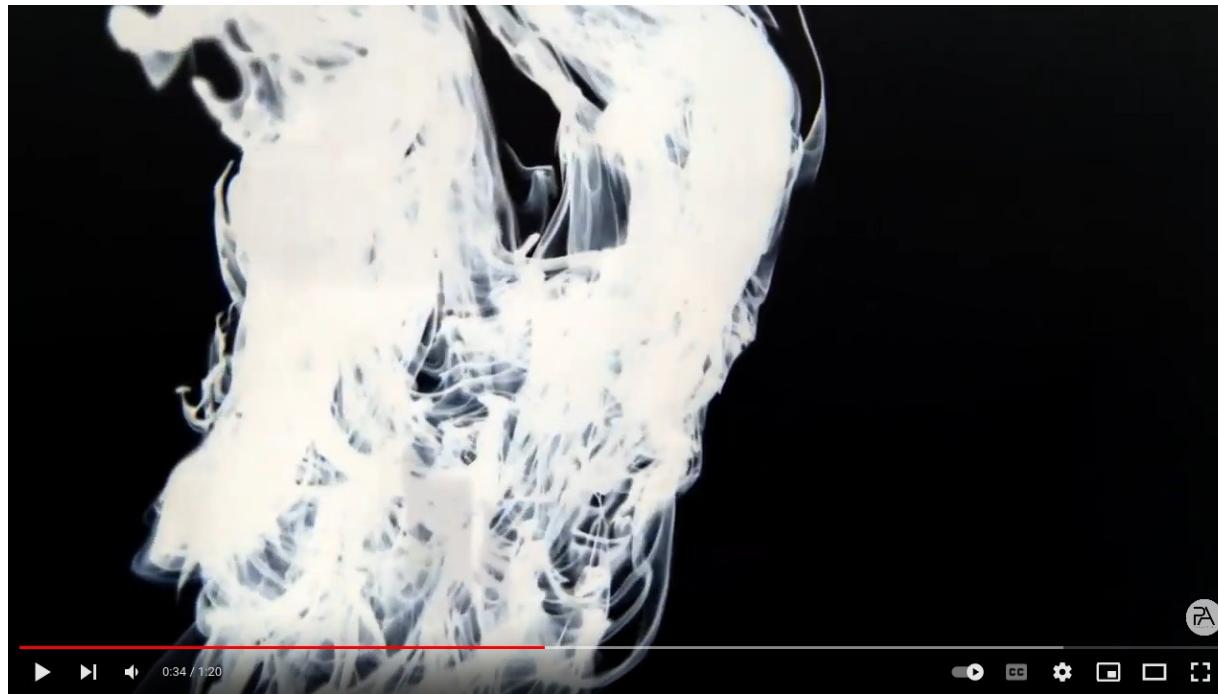

Random Walk model for Diffusion

Coding considerations:

Random number generators

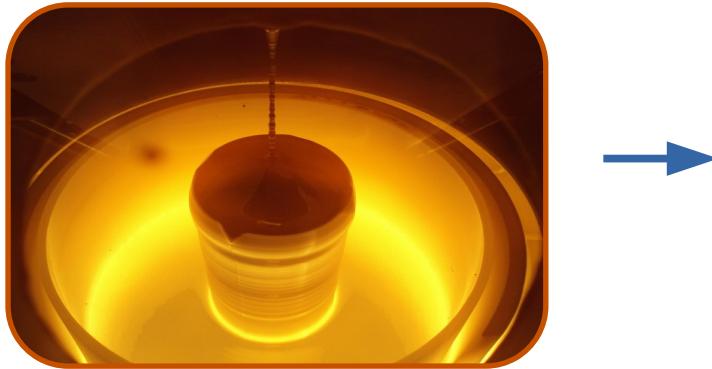

Binning probability distributions

# What is diffusion?

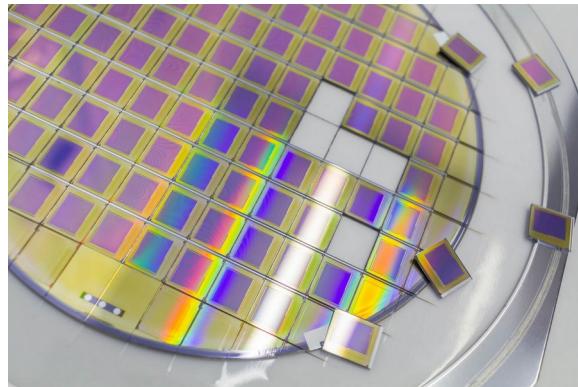

<https://www.youtube.com/watch?v=UlnbVuJvZM>

# Silicon Wafer Processing: Example of Diffusion in Materials Science

99.99999999% pure Silicon

A periodic table of elements where specific groups are highlighted by colored circles:

- Alkali metals: Li, Na, K, Cs, Fr
- Alkaline earth metals: Be, Mg, Ca, Sr, Ba, Ra
- Metalloids: B, Al, Ge, Si, P, As, Sb, Bi
- Actinides: Th, Pa, U, Np, Pu, Am, Cm, Bk, Cf, Es, Fm, Md, No, Lr
- Reactive nonmetals: N, O, F, Ne, S, Cl, Br, I, At, Rn
- Noble gases: He, Ne, Ar, Kr, Xe, Rn
- Post-transition metals: Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, In, Sn, Sb, Te, Pb, Bi, Po, At
- Transition metals: Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, In, Sn, Sb, Te, Pb, Bi, Po, At
- Lanthanides: Ce, Pr, Nd, Pm, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu
- Unknown properties: H, Be, Sc, Y, Zr, Hf, Ta, W, Re, Os, Ir, Pt, Au, Hg, Tl, Pb, Bi, Po, At, Rn

○ Alkali metals  
○ Metalloids  
○ Actinides

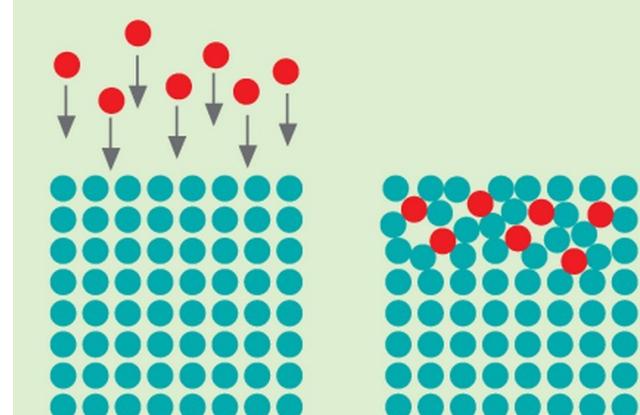

○ Alkaline earth metals  
○ Reactive nonmetals  
○ Noble gases

○ Transition metals  
○ Post-transition metals  
○ Lanthanides  
○ Unknown properties

# Silicon Wafer Processing: Example of Diffusion in Materials Science

**Intentional incorporation of impurities (e.g., boron, phosphorous)**

**Step 1:** Steady-state gas diffusion  
or ion implantation

**Step 2:** Drive-in process (higher temperature)  
→ uniform distribution of impurities

# Diffusion of Lithium ions in a battery

# Fick's First and Second Law

Continuum description

→ Fick's first law → empirical observation

$$[\bar{J}] = \frac{\text{mass}}{\text{mass flux} \cdot \text{area} \cdot \text{time}}$$

$$J_i = -D_i \bar{\nabla} c_i$$

concentration profile

↑ diffusivity

atoms diffuse down conc. gradient

$$\bar{\nabla} = \left( \frac{\partial}{\partial x}, \frac{\partial}{\partial y}, \frac{\partial}{\partial z} \right)$$

$$[\bar{J}] = \left[ \frac{\text{kg}}{\text{m}^2 \cdot \text{s}} \right]$$

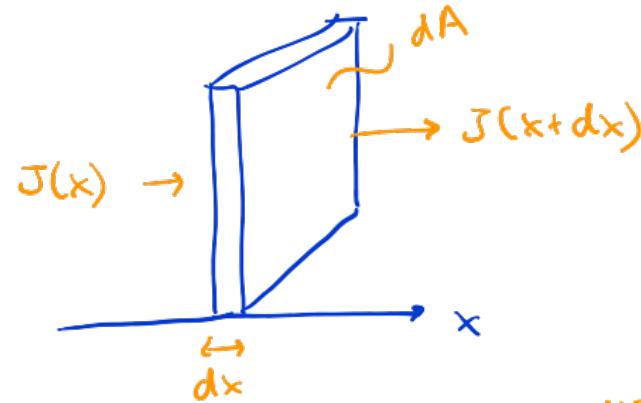

$$[\bar{\nabla} c_i] = \left[ \frac{\text{kg/m}^3 \cdot \frac{1}{\text{m}}}{\text{m}} \right]$$

$$\rightarrow [D] = \left[ \frac{\text{m}^2}{\text{s}} \right]$$

See also Appendix B7

# Fick's Second Law: Derivation

Based on conservation of mass

$$J(x) \cdot dA : \# \text{ atoms diffusing } C \times \text{per unit time}$$

$$J(x+dx) \cdot dA : \# \text{ atoms diffusing } C \times \text{per unit time}$$

$$[J(x) - J(x+dx)] \cdot dA = \text{net } \# \text{ atoms diffusing}$$

$$\boxed{\frac{\partial C}{\partial t} = D \bar{\nabla}^2 C}$$

$$V = dA \cdot dx \quad \text{volume of element}$$

$$CV = C \cdot dA \cdot dx \quad \# \text{ atoms diffusing in volume element}$$

$$\frac{d}{dt} (CV) = \frac{d}{dt} (C \cdot dA \cdot dx) \quad \text{rate of atoms diffusing in v.e.}$$

$$-\frac{dJ}{dx} \cdot dx \cdot dA$$

$$-\frac{dJ}{dx} dx \cdot dA = \frac{d}{dt} (C \cdot dA \cdot dx)$$

$$\frac{d}{dt} C = -\frac{dJ}{dx} \rightarrow$$

$$\frac{\partial C}{\partial t} = -\bar{\nabla} \bar{J} = +\bar{\nabla} (D \bar{\nabla} C)$$

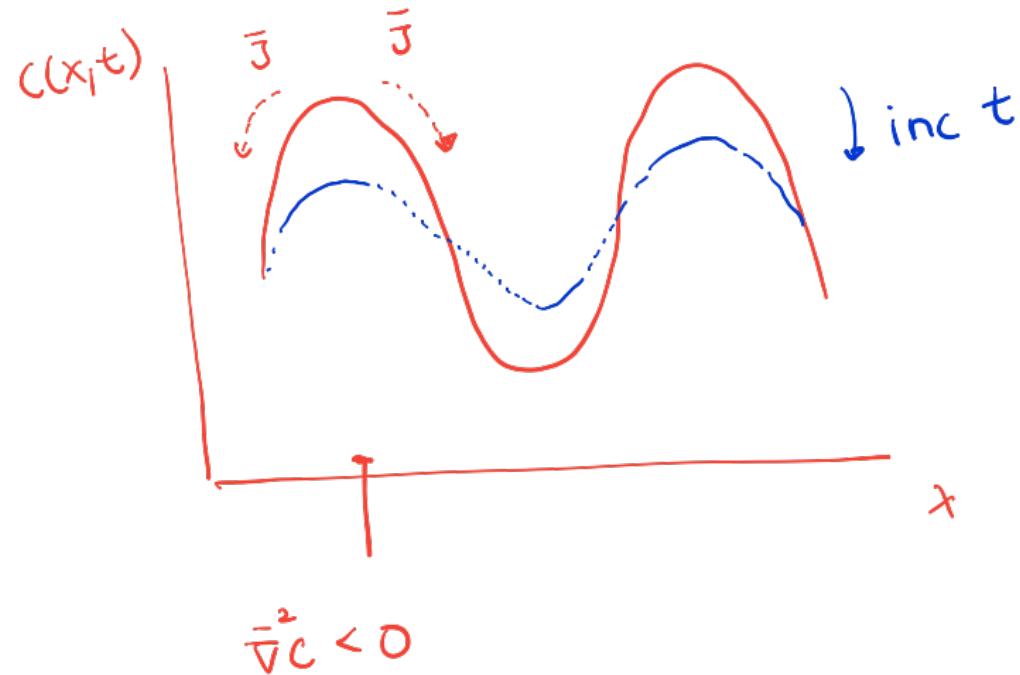

\* D spatially constant

# Fick's First and Second Law: Interpretation

Second Law

$$\frac{\partial C}{\partial t} = D \bar{\nabla}^2 C$$

$$J = -D \bar{\nabla} C$$

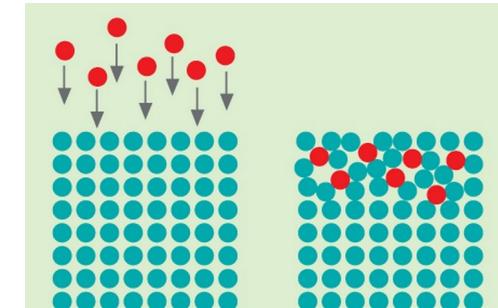

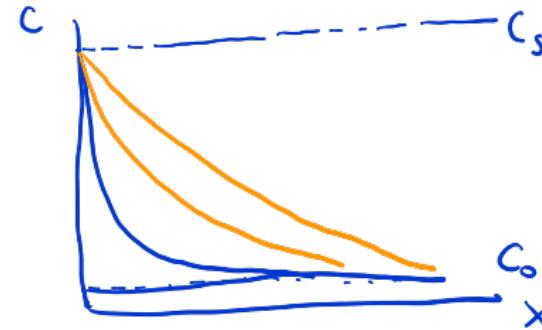

# Example: Silicon wafer processing

Intentional incorporation of impurities (e.g., boron, phosphorous)

**Step 1:** Steady-state gas diffusion or ion implantation

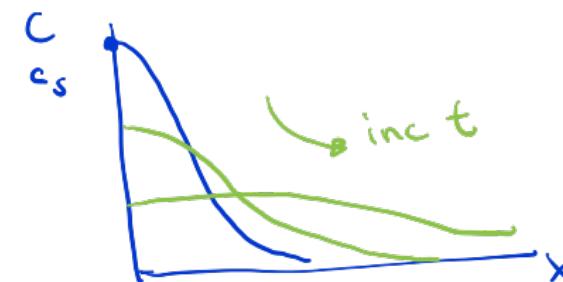

$$\frac{c(x,t) - c_0}{c_s - c_0} = 1 - \text{erf}\left(\frac{x}{\sqrt{4Dt}}\right)$$

**Step 2:** Drive-in process (higher temperature)

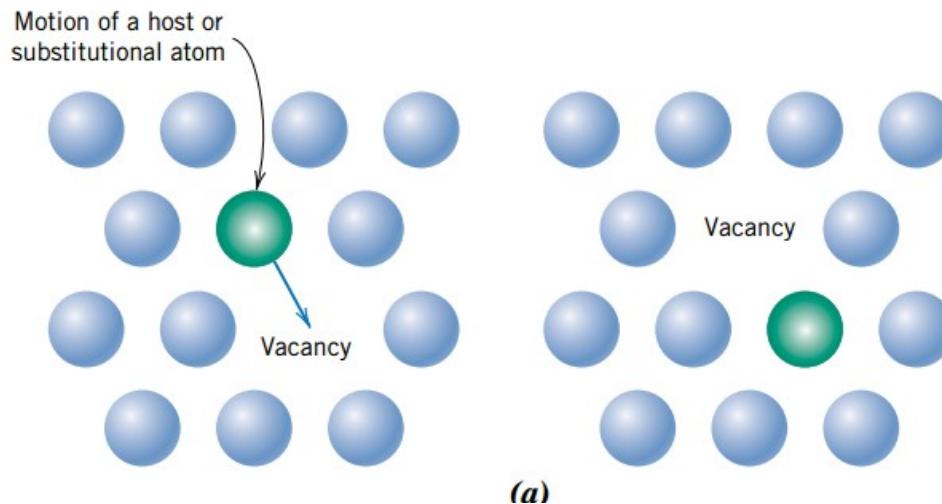

$$c(x,t) = \frac{2(C_s - c_0)}{\pi} \sqrt{\frac{D_p t_p}{4Dt}} \exp\left(-\frac{x^2}{4Dt}\right)$$

depend  
on step 1

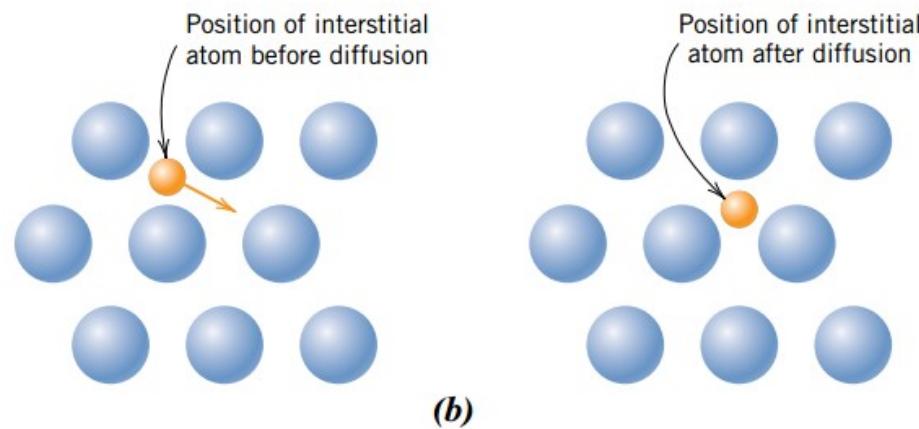

# Types of Diffusion

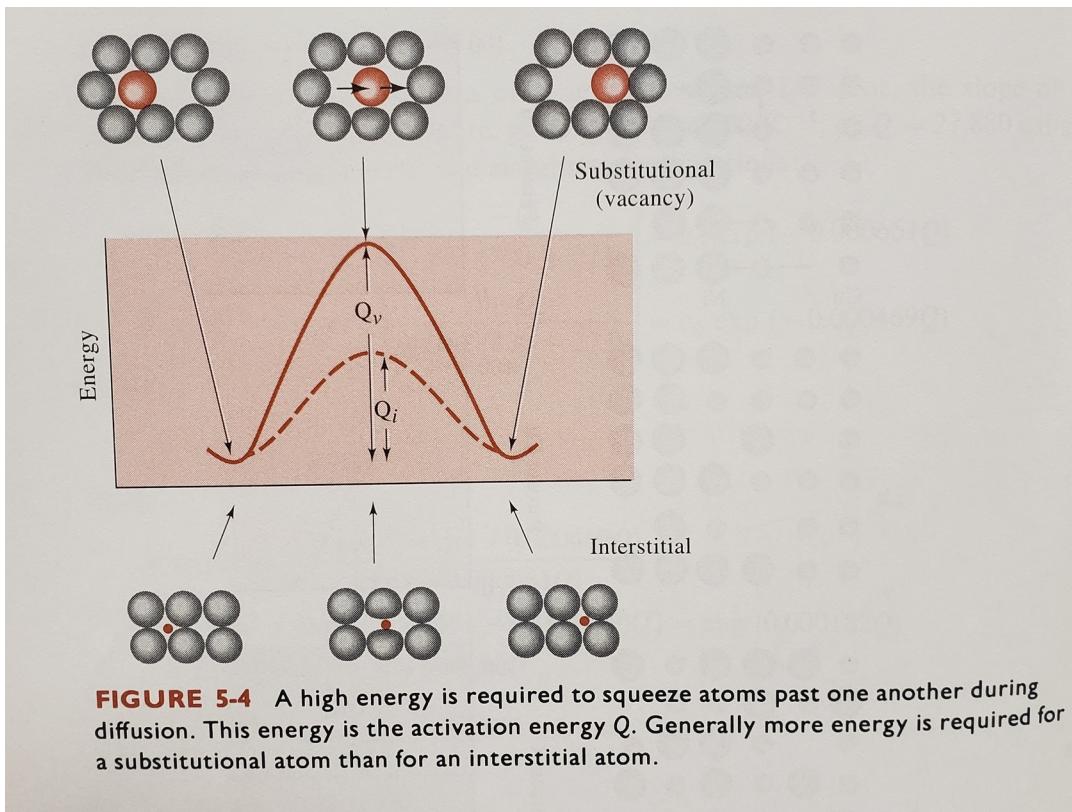

## Vacancy diffusion

## Interstitial diffusion

# Factors that affect diffusion: Diffusion coefficient

**FIGURE 5-4** A high energy is required to squeeze atoms past one another during diffusion. This energy is the activation energy  $Q$ . Generally more energy is required for a substitutional atom than for an interstitial atom.

$$D = D_0 \exp \left( -\frac{Q}{k_B T} \right)$$

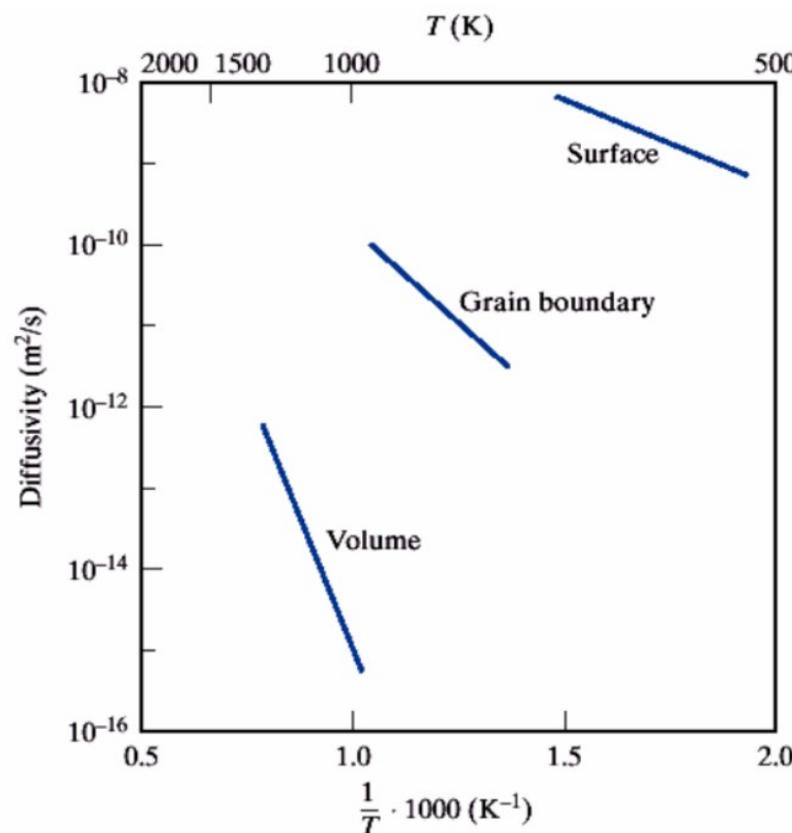

$k_B$  = Boltzmann's constant =  $R/N_A$

# Factors that affect diffusion: Diffusion coefficient

Solute	Solvent*	$\Delta E_D$ (kcal/mole)	$D_0$ (cm <sup>2</sup> /sec)	D (cm <sup>2</sup> /sec)	
				500°C	1000°C
C	Fe (BCC)	20	0.008	$1.8 \times 10^{-8}$	$3 \times 10^{-6}$
N	Fe (BCC)	18	0.007	$6 \times 10^{-8}$	$5.7 \times 10^{-6}$
H	Fe (FCC)	10	0.01	$1.5 \times 10^{-5}$	$1.9 \times 10^{-4}$
Ni	Fe (FCC)	66	0.5	$1 \times 10^{-19}$	$2.5 \times 10^{-12}$
Co	Fe (BCC)	54	0.2	$1.2 \times 10^{-16}$	$9 \times 10^{-11}$
Si	Fe (BCC)	48	0.4	$1.2 \times 10^{-14}$	$2.2 \times 10^{-9}$
Al	Cu	39	0.07	$5.6 \times 10^{-11}$	$1.5 \times 10^{-8}$
S	GaAs	92	4000	$3.5 \times 10^{-23}$	$1.6 \times 10^{-12}$
Zn	GaAs	57	$1.5 \times 10^{-8}$	$1.3 \times 10^{-24}$	$1.5 \times 10^{-18}$

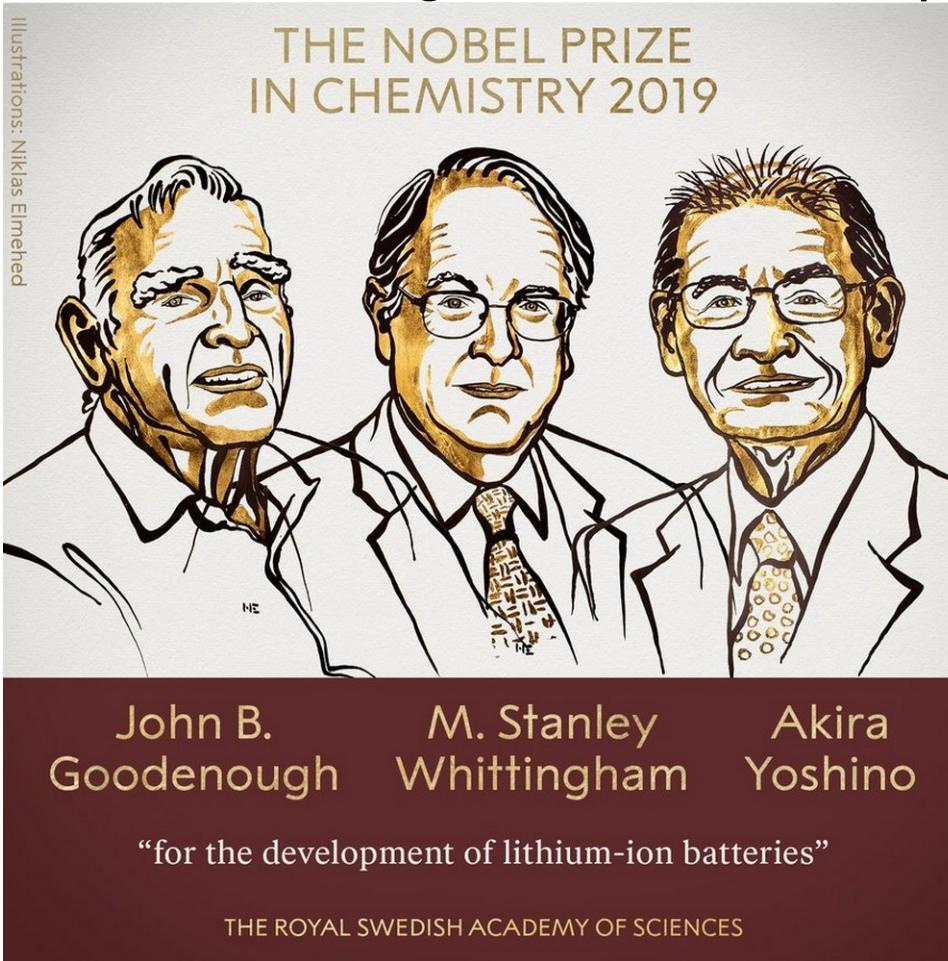

# Factors that affect diffusion: Diffusion coefficient

$$D = D_0 \exp\left(-\frac{Q}{k_B T}\right)$$

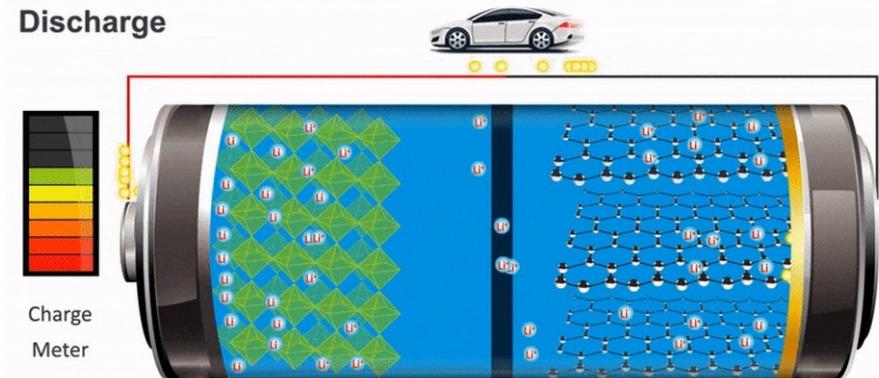

# What is the materials science behind the Li-ion battery winning the 2019 Nobel prize in Chemistry?

Illustrations: Niklas Elmehed

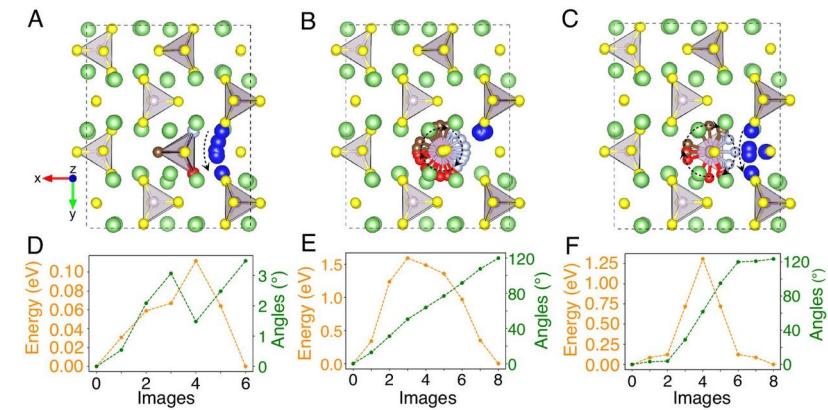

## How Lithium-ion Batteries Work

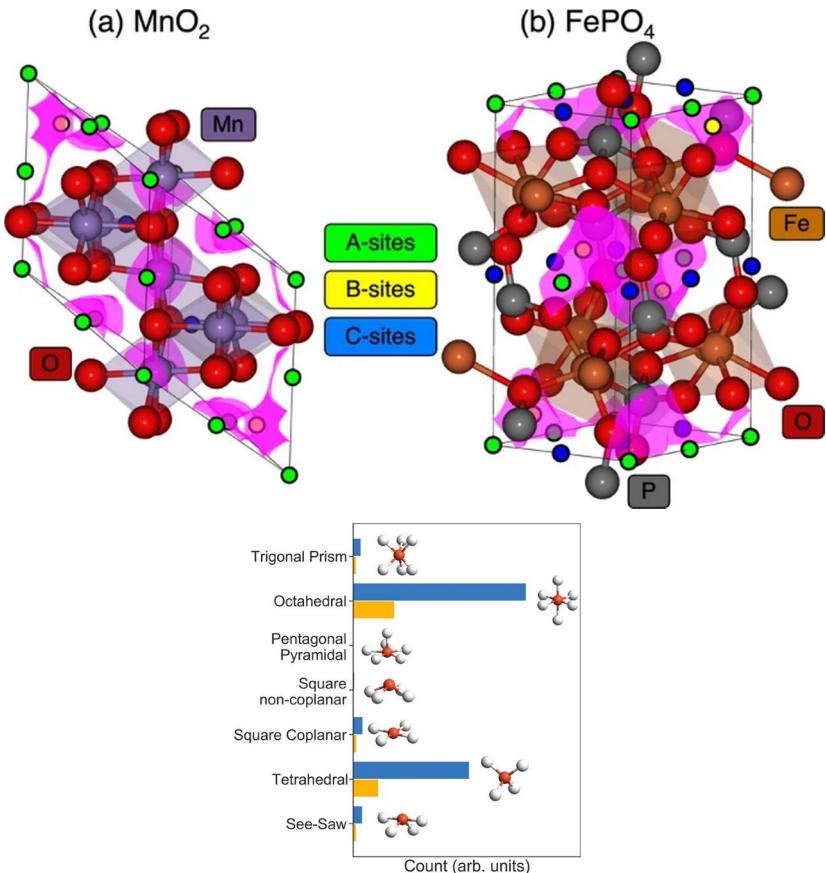

U.S. DEPARTMENT OF  
**ENERGY** | Office of ENERGY EFFICIENCY  
& RENEWABLE ENERGY

<https://www.energy.gov/science/doe-explainsbatteries>

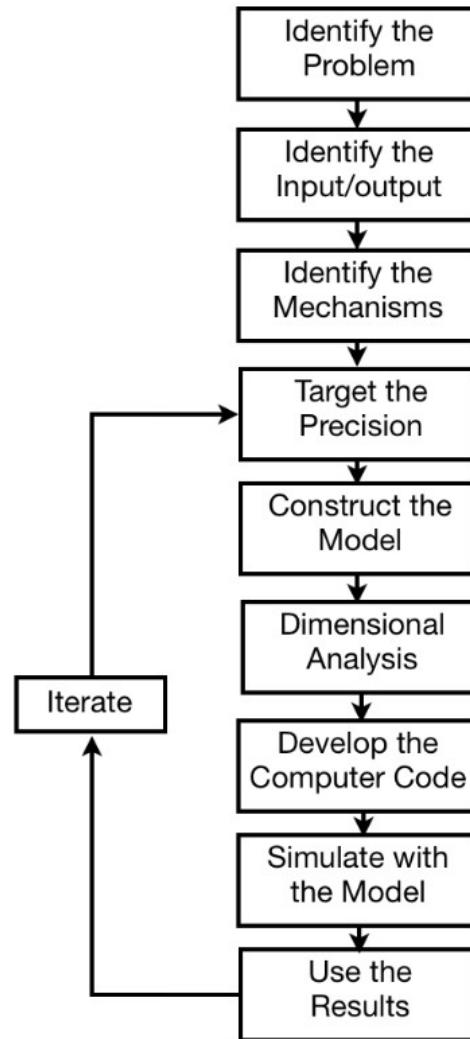

# Collective motion of lithium with crystal lattice

# Intercalation of lithium in novel cathode materials

# Developing a model

“Science and Statistics.” George E.P. Box (1976)

“All models are wrong, but some are useful.”

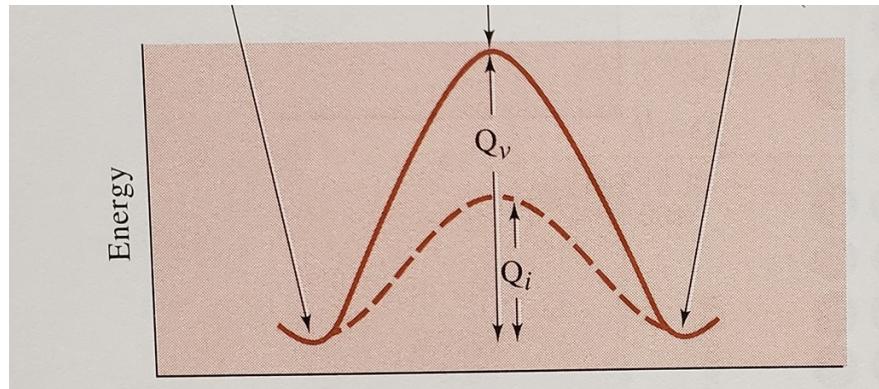

## 2.3 Parsimony

Since all models are wrong the scientist cannot obtain a “correct” one by excessive elaboration. On the contrary following William of Occam he should seek an economical description of natural phenomena. Just as the ability to devise simple but evocative models is the signature of the great scientist so overelaboration and overparameterization is often the mark of mediocrity.

## 2.4 Worrying Selectively

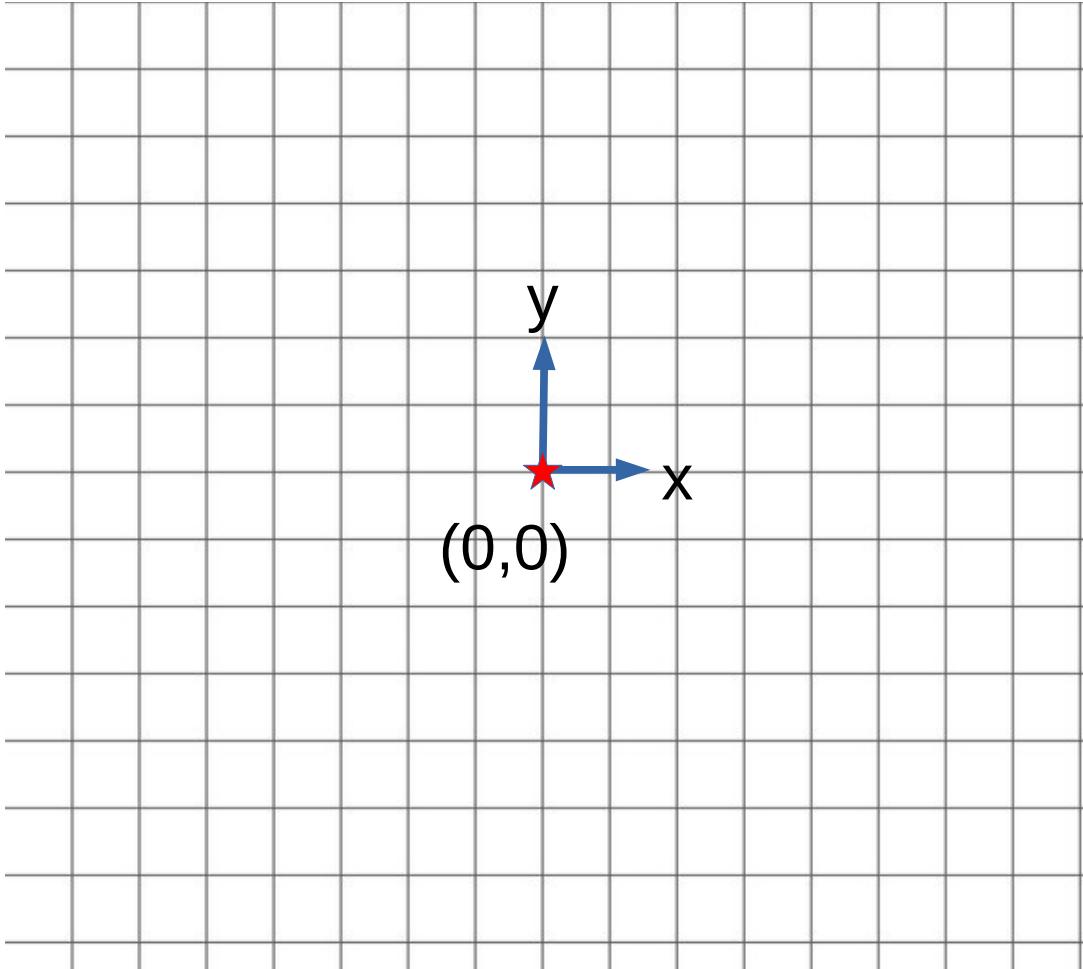

Since all models are wrong the scientist must be alert to what is importantly wrong. It is inappropriate to be concerned about mice when there are tigers abroad.

# Simplifications of the Random Walk Model

- Reduced dimensionality (to 2D or 1D)
- Simplification of the crystal structure
- Model the hops the atoms take as random (for a particular atom)

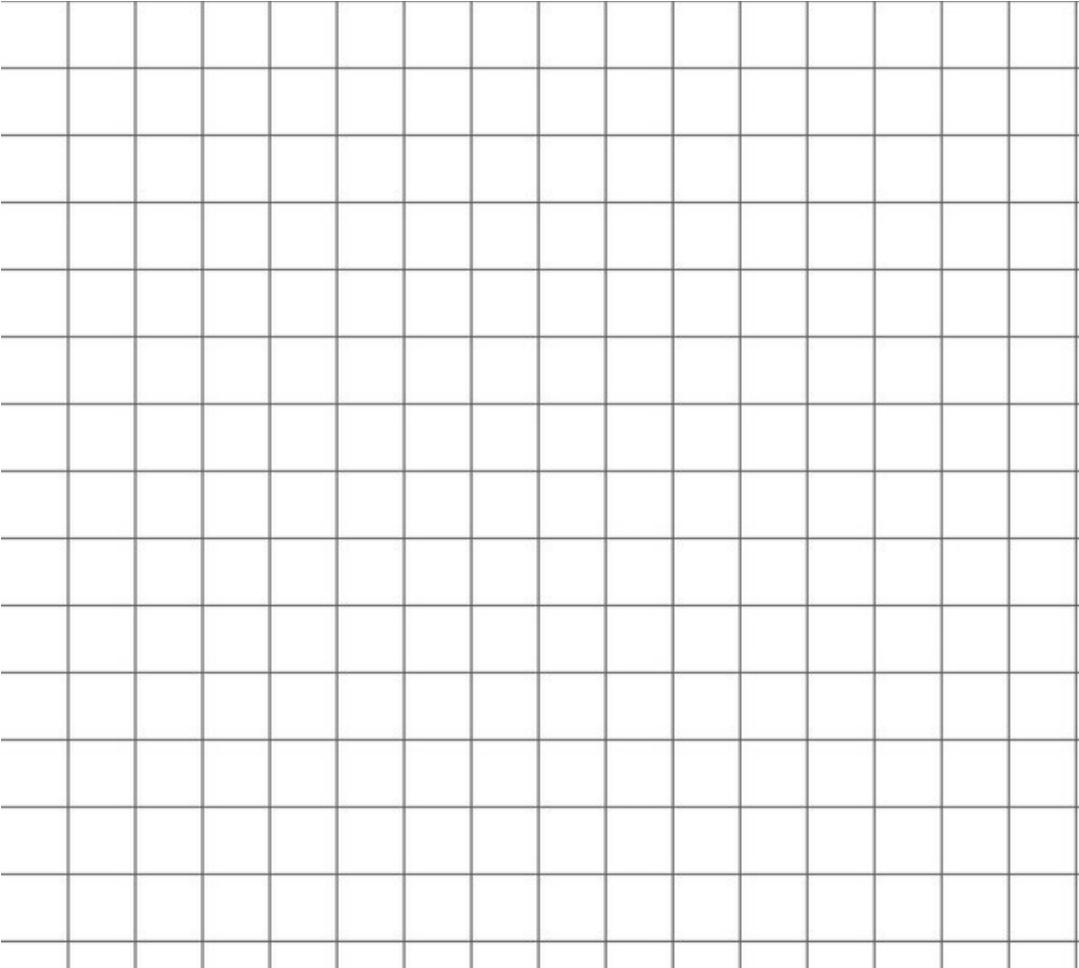

# Random walk diffusion: an atomic model for diffusion

## Rules for the random walker:

- divide time into  $nt$  discrete steps spaced by  $\Delta t$  time, where  $nt$  is an integer and  $\Delta t$  is a number
- can only move 1 space at each time step
- equal and random probability of moving up, down, left, right

# Connection between Random Walk and Diffusivity

1D case

# Connection between Random Walk and Diffusivity

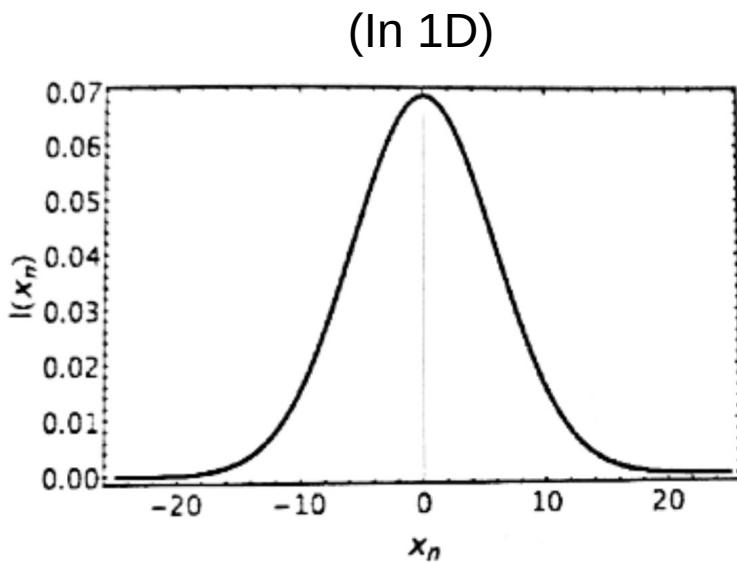

$$D = \frac{1}{6t} \langle R^2 \rangle \quad (\text{in 3D})$$

For the random walk model

# Statistics of the Random Walk Model: End-to-end distribution

1D case

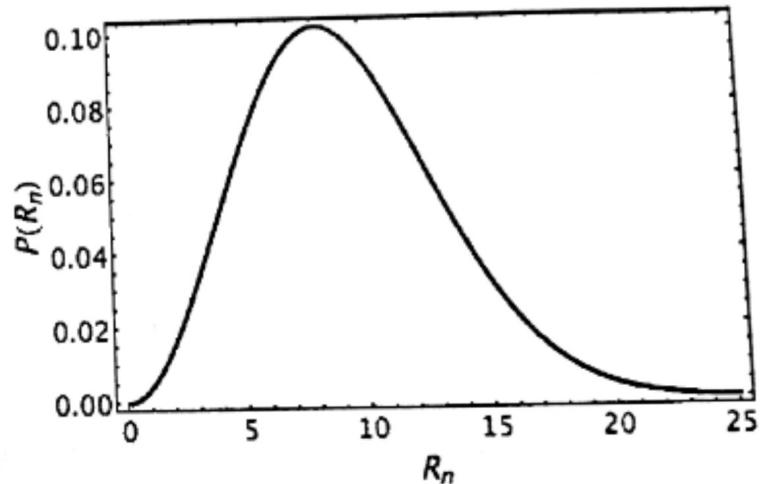

# Statistics of the Random Walk Model: End-to-end distribution

$$\mathcal{P}(n_{tot}, q) = \frac{1}{2} \frac{n_{tot}!}{\left(\frac{n_{tot}+q}{2}\right)!\left(\frac{n_{tot}-q}{2}\right)!}$$

# Statistics of the Random Walk Model: End-to-end distribution

(In 3D)

# Coding considerations:

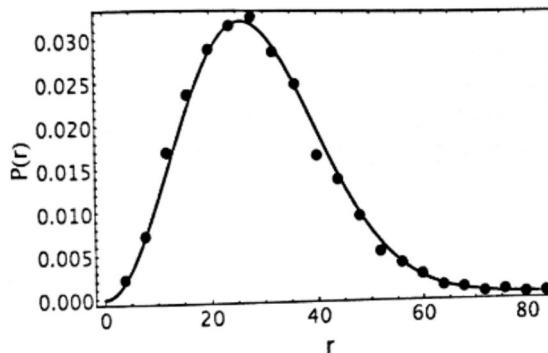

## Binning distributions

Discretizing continuous functions

Appendix I.3

Choose  $n_{bin}$

$$\Delta = \frac{R_n^{max} - R_n^{min}}{n_{bin}}$$

## Random Number Generator

Discretizing continuous functions  
Appendix I.2

To reproduce a “random” result,  
pick a consistent seed

Python:

`numpy.random.rand(...)`: generates (pseudo-)random number over [0,1)

`numpy.ceil(...)`: round to next highest integer

# An implementation of the 2D Random Walk Diffusion

## Objective

User chooses  $nt$  = number of time steps

## Concept

Variable, integer

## Python Representation

`nt`

# An implementation of the 2D Random Walk Diffusion

## Objective

User chooses  $nt$  = number of time steps

---

Keep track of position of random walker  
at each time step.  
Let's assume it starts at the origin.

---

## Concept

Variable, integer

---

Array (list of items)  
e.g., [3, 4.5, 8, -1]

2D →  $x$  and  $y$  coordinate  
for each position

---

## Python Representation

`nt`

---

Use the library numpy,  
shorthand is np:

`x = np.zeros(nt+1)`  
`y = np.zeros(nt+1)`

---

# An implementation of the 2D Random Walk Diffusion

## Objective

User chooses  $nt$  = number of time steps

Keep track of position of random walker  
at each time step.  
Let's assume it starts at the origin.

Specify how the position changes at  
each time step.

## Concept

Variable, integer

Array (list of items)  
e.g., [3, 4.5, 8, -1]

2D →  $x$  and  $y$  coordinate  
for each position

## Python Representation

`nt`

Use the library numpy,  
shorthand is np:

```
x = np.zeros(nt+1)
y = np.zeros(nt+1)
```

```
delx =
np.array([?, ?, ?, ?])
dely =
np.array([?, ?, ?, ?])
```

# An implementation of the 2D Random Walk Diffusion

## Objective

User chooses  $nt$  = number of time steps

Keep track of position of random walker at each time step.

Let's assume it starts at the origin.

Specify how the position changes at each time step.

Save each new position of the diffusion path

## Concept

Variable, integer

Array (list of items)  
e.g., [3, 4.5, 8, -1]

2D →  $x$  and  $y$  coordinate for each position

Index the array  
i.e., access a specific element  
“zero index”

## Python Representation

`nt`

Use the library numpy,  
shorthand is np:

```
x = np.zeros(nt+1)
y = np.zeros(nt+1)
```

```
delx =
np.array([?, ?, ?, ?])
dely =
np.array([?, ?, ?, ?])
x = [1, 2, 3]
x[0] = 1
x[1] = 2
```

# An implementation of the 2D Random Walk Diffusion

## Objective

Repeat for  $nt$  times

Encode the random number to a change in position of the random walker

## Concept

for loop  
range function

Generate a (pseudo)-random number

## Python Representation

Input:

```
for i in range(3):  
    print(i)
```

Output:

```
0  
1  
2
```

```
np.floor(4* np.random.rand(nt))
```

Generate random number b/t 0 and 1

Random number b/t 0 and 4

Random integer: 0, 1, 2, 3
